Object detection using Connected Components Labeling

CLAUDIU ADRIAN TODORUȚ

Claudiu Adrian Todoruț: Department of Automation,
Technical University of Cluj-Napoca,
Memorandumului 28, Romania
todorutclaudiu@yahoo.com

ABSTRACT: In this paper an implementation is presented for object detection using Connected Components Labeling algorithm which is superior to other methods. By implementing this algorithm it is detected objects of various forms: circles, rectangles and triangles.

KEY WORDS: Pattern recognition, classification, object detection, connected components labeling

ABSTRACT: Starting with the Bernstein's operators $\bar{B}_n : C\left[0, \frac{n}{n+1}\right] \rightarrow C\left[0, \frac{n}{n+1}\right]$, we construct the associated Kantorovich operators $\bar{K}_n : L_1\left[0, \frac{n}{n+1}\right] \rightarrow C\left[0, \frac{n}{n+1}\right]$ and we study some of their approximation properties.

ABSTRACT: Since the water supply by precipitation is of big importance in the water management resources, especially in regions with high drought, this article has two purposes. We start by performing the statistical analysis of precipitation series, in order to detect their characteristics. Then, we build the trend evolution for each individual series, using the wavelets approach. Finally, the model for the regional evolution of precipitation is detected, using the ensemble of data series. The data base is formed by 41 series collected at the secondary hydrological stations from Dobrogea region, Romania.

KEY WORDS: Autocorrelation, break point, trend, wavelets

400084 Cluj-Napoca, Romania

cpblaga@math.ubbcluj.ro

ABSTRACT: In this note we examine the circular time-like geodesics near a spherically symmetric dilaton black hole, described using the exact solution for a static charged black hole found by Gibbons and Maeda and, independently, by Garfinkle, Horowitz and Strominger. The existence and stability of the circular orbits are analysed using the effective potential of a free material test particle moving on time-like geodesic near this black hole. We determine the radius of the innermost stable circular orbit, the radius of the shortest circular orbit and compare our results with those obtained by other authors for specific values of the parameters involved in our analysis.

KEY WORDS: circular time-like geodesics, dilaton black holes, effective potential

pablaga@cs.ubbcluj.ro

ABSTRACT: In this paper, we show that, in the projective model of the hyperbolic plane, we can adapt the classical trilinear and barycentric coordinates to the hyperbolic plane. We mention that these coordinates were invented by Sommerville in the early thirties, but he resumed to the discussion of the elliptic case. We use the method of polarities to write down the equation of the Absolute, both in point and line coordinates and provide the basic formulae for computation of angles and distances. At the end, we find the coordinates of the incenter and those of the centroid of the reference triangle and show that they are unit points for the trilinear and barycentric coordinate system, respectively.

ABSTRACT: Given two means M and N , the mean P is called (M, N) -invariant if $P(M, N) = P$. At the same time the mean N is called complementary to M with respect to P . We use the method of series expansion of means to determine the complementary with respect to a weighted Lehmer mean. The invariance of a weighted Lehmer mean in the family of weighted Gini means is also studied. We use the computer algebra Maple for solving some complicated systems of equations.

ABSTRACT: Fisher information is a fundamental concept of statistical theory and plays an important role in many areas of statistical analysis. Importance of Fisher information as a measure of the information in a distribution is well known. In this article, under certain regularity conditions, we analyze some properties of the score functions and of the Fisher informations in the case of the continuous random variables as well as for some sums of continuous random variables. A similar study was made by Barron and Johnson in the papers [1] and [2].

ABSTRACT: We present a study of some linear programming formulations used in the estimation of optical flow. We focus on a version of the Horn-Schunck model with the l_1 norm in place of the classical l_2 norm. We analyze two linear programming reformulations of the l_1 minimization problem and address issues related to the linear structure induced by the optical flow problem in the context of primal-dual interior point methods. Some of the linear algebra structures may be exploited by parallel algorithms.

ABSTRACT: A sequence of positive linear operators (P_n) , representing a link between Bernstein polynomials and Durrmeyer polynomials with Jacobi weights, was introduced by the first author in [3] and studied in [4]-[5]. In this paper we associate to the sequence (P_n) a simpler sequence (V_n) , representing a link between Bernstein polynomials and certain Stancu polynomials. We investigate the properties of these sequences and the relationship between them.

Relations between the homomorphisms of $(k + 1)$ -groups and the homomorphisms of their $(n + 1)$ -retracts

VASILE POP

Vasile Pop: Universitatea Tehnică Cluj-Napoca, Str. Memorandumului 28, 400114 Cluj-Napoca, Romania
vasile.pop@math.utcluj.ro

ABSTRACT: Let n and k be natural numbers. If k is a multiple of n , Dudek and Micholski [2] emphasized a functor from $(k + 1)$ -group category to the $(n + 1)$ -group category, by which to a $(k + 1)$ -group is associated a $(n + 1)$ -group called its retract. A part of relations between the morphisms of the two polyadic groups were previously studied by I. Corovei, I. Purdea, V. Pop [4], [5]. In this paper we complete these results, especially, by establishing the conditions under which a morphism between two retracts is also a morphism between the groups from which they derive.
